

Custom Header HTML

You may include the following kinds of HTML content in your app's HTML Header:

- `<script> .. </script>` tags, see: [w3Schools](#)
- `<style> .. </style>` tags, see: [w3Schools](#)
- `<link> .. </link>` tags, see: [w3Schools](#)
- `<meta> .. </meta>` tags, see: [w3Schools](#)

Script tags may include external libraries and any custom Javascript or jQuery. Keep in mind that JavaScript code in a custom header will not execute until some action calls your code. You can find out more about adding custom JavaScript and jQuery code in these sections:

- [Writing custom JavaScript](#)
- [Using device features with JavaScript](#)
- [Customizing with jQuery](#)
- [JavaScript & jQuery Cookbook](#)

All JavaScript code that you include in the HTML Header must be encased within `<script> .. </script>` tags.
