

REST API Web Services

For REST Web Services , you can map the device fields to the parameters of your REST API requests using Javascript. Because of the large variation of authentication with REST API's, there is no visual interface for this service. To use REST you will need to know Javascript, jQuery, and JSON or XML and enter your code for your REST API in the custom HTML header. You can find examples of using REST Web Services here:

- [Customizing with jQuery, Getting data from websites \(AJAX\)](#)
- [JavaScript & jQuery Cookbook](#)
